</table>
Frame Tie Anchor Installation
1. Position anchor at a slight back angle (10°) so that when fully installed, the anchor head will be inside any skirting or side wall.

2. Install anchor to +/- 2/3 depth, then install stabilizer vertically, within 3"- 4" of anchor shaft, parallel to wall of home.

3. Fully drive anchor, attach strap (see proper strap tensioning), and pretension strap to pull anchor rod against the stabilizer plate.

Manual Anchor Installation
1. Dig holes to a depth of 2/3 of the anchor length. Install anchor with rod or length of pipe for leverage.

2. Replace earth in hole after anchor/plate is installed at full depth. Pack dirt with a tamping rod every 6 inches of fill.

3. Testing may be required in loose soil conditions to check that anchor has proper holding power.

IMPORTANT!
Anchor must be installed to full depth. Anchor head must be at ground level or at the top of the stabilizer plate which is fully installed to ground level.

Electric Drive Machine Installation
Operating Instructions:
1. Attach adapter head to shaft of the EDM motor, tighten set screw.

2. Place extension handle in the end of the EDM if needed.

3. Place anchor head into adapter, line up anchor shaft with EDM shaft, for easier installation.

4. Flip forward/reverse switch to forward.

5. Place anchor tip in location where anchor is to be buried. Hold on/off switch to install.

Electric Drive Machine Cautions and Warnings:
• Before installation of any ground anchor, determine that the ground anchors to be installed will not be near any underground electrical cables, phone lines, water lines, sewer pipes, or gas lines. Failure to do so may result in serious injury or death.

• The EDM is designed for operation by two people.

• Do not allow the EDM to be wedged against the home or other solid objects, when operating the EDM.

• Electrical cord must be a minimum of 12-2 wire size w/ground up to 50’. Longer cords should be 10-2 wire size with ground.

• Never operate the EDM in wet or rainy conditions.

• Frayed or patched electrical cords should never be used with the EDM.

• Care should be taken to keep electrical cords away from anchors.

• Never operate drive machine without the GFI power cord. Damage to motor and injury to operator can result from by passing the GFI.

• The GFI will shut off power when a ground fault is detected. The GFI will also shut off power when it detects low voltage improper amps required to drive the motor. Many times the problem will be the use of an extension cord that is too long or is too light in gauge.
Anchor Stabilizers

In order to prevent lateral movement of manufactured homes subjected to high wind loads and to comply with HUD’s Wind Zone I, II, & III requirements, all lateral frame ties must be attached to a properly stabilized ground anchor. (Two approved methods illustrated below.)

Stabilizer Plate Installation

1. Refer to any and all local, state and federal regulations.

2. Use the Soil Test Probe at the anchor location in order to match soil class with the anchor/stabilizer (see page 16).

3. Partially install anchor to allow 14” to 16” remaining above ground level.

4. Utilizing oversized hammer, vertically install stabilizer plate, nesting anchor rod in between formed channels on outside of stabilizer plate (between anchor and frame).

5. Fully install anchor so that head is at the surface of the soil (1” tolerance, if necessary) and pretension anchor until touching stabilizer plate.

Deep Set Anchor/Stabilizer Instructions

1. Confirm soil classification using standard torque probe at proper depth below ground surface, make certain readings meet or exceed torque readings for Class 2 and 3 soils at the depths of 12” & 36”.

2. Clear loose vegetation where anchor will be installed. Install anchor vertically to its’ full depth. Stabilizer plate at the top of anchor must be fully embedded into soil.

3. Pull strap past anchor head and cut strap so that there is 12” to 15” of strap to wrap onto anchor bolt insuring 4 to 5 wraps minimum.

4. Insert strap into anchor bolt flush with opposite side of bolt. Tighten bolt/strap until tight. Secure anchor bolt with nut.
**Quik-Set Stabilizer Installation**

1. Install ground anchor inside skirting line at a slight back angle of 10° - 15°.

2. While anchor head is still 5” to 6” above ground level: install Quik Set stabilization plate around anchor shaft, referring to the direction imprinted on the top of the plate.

3. Install ground anchor until Quik-Set plate is fully set. Hammering may be required at the corners to insure plate being fully driven.

4. Install strap(s) to anchor head and pretension according to approved methods. Maximum anchor load in conjunction with the “Quik-Set” device is 4725 lbs. (ultimate).

**ABS Stabilizer Plate**

1. Determine correct anchor to be used with the home installation and use the manufacturer instruction for installation, following all safety precautions.

2. Using an electric drive machine, install anchor to a depth of approximately 28 inches at a slight back angle.

3. Dig out an 8” wide area so that the ABS stabilizer will be placed on undisturbed soil at a 10 to 15 degree angle toward the home. The bottom center of the plate should be touching the anchor rod.

4. Complete the installation of the ground anchor until the bottom of the anchor head is flush with the ground.

5. Attach proper strap and tension strap until anchor head is flush against the ABS plate and strap is tight. At this point, soil should be tamped into the vacant area behind the anchor rod, tamping approximately 6” and repeating until the vacant area is flush with the surface of the surrounding ground.

**Asphalt Anchor Installation**

1. Using a masonry or similar abrasive blade in a circular saw, cut a slot 8” long x 1 ½” deep in the asphalt where the anchor is to be installed with the plates of the anchor parallel to the structure.

2. With a 5/8” masonry bit installed in a hammer drill, pre-drill a hole approx. 12” deep through the asphalt in the center of the slot.

3. Drive the anchor into the asphalt using a minimum 10 lb. sledge hammer or heavy hammer drill until the upper edge of the top anchor plate is 1” under the asphalt.

For horizontal anchorage at a maximum of 50 degrees, not for vertical anchorage.
Certified Galvanized Strapping*

The steel strapping by Tie Down Engineering for the manufactured housing industry has been tested to, and conforms to, the HUD Code as referenced in Part 3280 of the Manufactured Home Construction and Safety Standards and Part 3285 of the installation standards; Final Rule.

3280.306(f), 3285.402(b2) Anchoring Equipment – Load Resistance. Anchoring equipment shall be capable of resisting an allowable working load equal to or exceeding 3,150 pounds and shall be capable of withstanding a 50 percent overload (4,725 pounds total) without failure of either the anchoring equipment or the attachment point on the manufactured home.

3280.306(g), 3285.402(b2) Anchoring Equipment – Weatherization
Anchoring equipment exposed to weathering shall have a resistance to weather deterioration at least equivalent to that provided by a coating of zinc on steel of not less than 0.30 ounces per square foot of surface coated, and in accordance with the following:

(1) Slit or cut edges of zinc-coated steel strapping do not need to be zinc coated.
(2) Type 1, Finish B, Grade 1 steel strapping, 1-1/4 inches wide and 0.035 inches in thickness, certified by a registered professional engineer or architect as conforming with ASTM Standard Specification D3953-97, Standard Specification for Strapping, Flat Steel, and Seals.

The above specification of a minimum coating of 0.30 ounces per square foot equates to a designation of “G30.” Tie Down strapping exceeds this minimum requirement with a coating of 0.60 (G60) or 1.20 (G120) ounces as per above. Similarly, Tie Down strapping exceeds, in testing, the minimum load requirements of 3,150 pounds design (working) load and 4,725 pounds (ultimate) overload.

Proper Strap Tensioning

Step 1
Insert slotted bolt into anchor head, attach loosely. Pull strap past bolt head and cut strap so that 12-15 inches of strap are available to wrap onto the slotted bolt.

Step 2
Insert the strap end into the slot in bolt until flush with opposite side of bolt.

Step 3
Using 15/16” wrench or socket, turn the bolt, winding the strap so that a minimum of four to five complete turns are made, and the strap is adequately tensioned.

Step 4
Hold the bolt under tension while tightening the nut, drawing the head of the bolt into the recess. After the bolt is within the recess, continue to tighten the nut until securely fastened.

Tip: TIE DOWN’S SPEED WRENCH cuts time required to tension strap in half!
Strap Tensioning - Speed Wrench, Part #48900

Tie Down’s SPEED WRENCH simplifies anchor installation with a design that allows for one handed operation for installing slotted bolts and tensioning strap. The SPEED WRENCH has a 15/16” impact socket on one side and a 15/16” “nut” on the other. Combine this with your own ratchet and 15/16” socket and you have the fastest way to tighten slotted bolts!

Step 1
Place Speed Wrench over the bolt head. Insert the strap end into the slot in bolt until flush with opposite side of bolt.

Step 2
Hold Speed Wrench in place, tighten bolt with socket wrench on outside of Speed Wrench (bolt head side).

Step 3
Move socket to the opposite (nut) side. Hold Speed Wrench in place. Use socket wrench to tighten nut.

Strap Splice

To lengthen strap in the field, a double crimp seal splice is required. Overlap strap approximately 12 inches and use two crimp seals evenly spaced, with 2 crimps per seal.

Strap Attachment

One crimp seal is used when strap is attached to a sidewall bracket or a strap connector. If the bracket does not have a radius edge, a radius clip (short “U” shaped piece of strap) must be placed between the strap and contact point to protect the strap from sharp edges. Verify state requirements for number of crimp seals required.
Strap Protectors
For protecting Vertical and Diagonal Strapping at sharp corners when wrapping the top and bottom of the beam.

Attach hook between strap and I-beam and fold perforated lip around the beam leaving 2 legs to guide the strap into position.

Frame Tie to Anchor
If this angle exceeds 60°, an additional frame tie must be attached to the opposite beam as indicated by the dotted line.

A Stabilizer Plate must be installed on all frame Ties. (or alternate method of stabilizing ground anchor.)

Select proper anchor for soil conditions using the Soil Test Probe, or other approved method of determining soil classification.
NOTE: Make sure you have strap protection against sharp edges for the applications on this page.

Frame Tie with Hook

Step 1
Attach frame hook to top inboard location of “I” beam.

Step 2
Keeping in line with the hook, wrap galvanized strap completely around “I” beam.

Step 3
Thread loose end of strap through slotted tensioning bolt attached to tension head of anchor. (Anchor must be properly installed into the ground before proceeding with step #4.)

Step 4
Tighten slotted tensioning bolt a minimum of 4 to 5 full turns until all slack in strap is removed.

Frame Tie with Buckle

Step 1
Install strap by pushing the end between the inside of the frame “I” beam and the floor.

Step 2
Position the buckle at upper end of the “I” beam frame. Wrap the end of the strap around the “I” beam. Thread the end of the strap through the slot in the buckle as shown. Push the end of strap in-between “I” beam and floor.

Step 3
Pull the strap, making certain the buckle stays in position. Thread loose end of strap thru slotted tensioning bolt attached to tension head of anchor. Tighten slotted tensioning bolt a minimum of 4 to 5 full turns until all slack in strap is removed.

Strap Buckle - MBU

Step 1
Thread length of frame tie strap through strap buckle as shown.

Step 2
Next, thread long end of strap between frame and floor of home. Bring strap through buckle as shown in diagram and fasten to anchor head.

Step 3
Diagram shows strap in position around frame and through buckle. It is important to remove all slack from system.
NOTE - Swivel Strap Connectors
1. Refer to local, State, and Federal regulations prior to installation in order to assure compliance.
2. Soil Test Probe the anchor location prior to installation in order to match the soil classification with the proper anchor/stabilizer combination.
3. Install tested and approved Tie Down Engineering anchor products.

59002 & 59242 Swivel Strap Connectors.

Swivel Strap Connectors
Beam Method:

Step 1
Frame ties attach to the beam with a swivel frame connector. This method provides the strongest and safest connection.

Step 2
Attach the swivel frame connector beam hook to the top of the I-beam from either the front or the back side. The angled or hook end of the beam hook should be snug against the inside top I-beam flange.

Step 3
Attach the swivel connector to the underside of the flange and frame hook with a 1/2” grade 5 bolt and nut. This allows the swivel connector to pivot and lock onto the I-beam.

Universal Swivel Strap Connectors
Sidewall Methods:

Sidewall & Longitudinal Slotted
Insert strap connector at a 45 degree angle. Return to 90 degree angle, pull down and attach to ground anchor. (Slotted connections must be straight pull. Bolted connections can have 15 degree max. angle.)

Sidewall w/Nut & Bolt
Attach strap connector to sidewall connector with nut & bolt, then attach to ground anchor.
**Gator Beam Clamp**

4 Bolt Gator Clamp (Wind Zone 1, 2 & 3)  #58999
8 Bolt Gator Clamp (Wind Zone 3 - and Florida)  #59011

**Step 1**
Determine anchor/stabilizer plate location and bracket location on I-beam to insure a 45° or lower strap angle.

**Step 2**
Attach beam clamp with 1/2” Grade 5 bolts and nuts as shown.

**Step 3**
Connect swivel connector and strap to bolt nearest to anchor with a 1/2” Grade 5 bolt and nut.

**Angle Frame Bracket** Part #59009

**NOTE:**
Frame Brackets must be attached with a Swivel Strap Connector #59002.

**Step 1**
Determine anchor/stabilizer plate location and bracket location on I-beam to insure a 45° or lower strap angle.

**Step 2**
Drill a 1/2” hole, centered in the I-beam as shown. Hole must be a minimum of 4” from any edge of the I-beam.

**Step 3**
Connect the two Frame Brackets (R & L) with a 1/2” Grade 5 bolt and nut for Wind Zone II & III and one frame bracket right or left for Wind Zone I.

**Step 4**
Attach swivel connector and strap to Angle Frame Brackets with 1/2” Grade 5 bolts and nuts. Tighten all bolts.
Patio Slab Anchor
This anchor is designed to be inserted through a 3/4" hole drilled or formed into an existing concrete slab.

- Concrete must be a 2500 PSI minimum slab with 4" minimum thickness.
- Concrete slab must allow 4725 lbs of vertical tension on anchor without lifting. This assumes that the concrete weighs 150 lbs per cu. ft.
- Minimum distance from the anchor shaft to one edge of the slab is 4 in. from one edge and 2 ft. from any other edge.

Concrete "J" Anchor
The MIJ2 is designed to be installed into a concrete slab at the time the concrete is being poured.

- Concrete must be a 2500 PSI minimum slab with 4" minimum thickness.
- Concrete slab must allow 4725 lbs of vertical tension on anchor without lifting. This assumes that the concrete weighs 150 lbs per cu. ft.
- Minimum distance from the anchor shaft to one edge of the slab is 4" from one edge.
- Concrete slab must have a minimum thickness equal to the anchors length plus 2” at embedment locations.

Concrete Slab Anchor
This anchor is designed to be bolted to an expansion sleeve in an existing concrete slab.

- Drill a 5/8 in x 3 in. hole in the slab where the anchor head is to be located.
- Place steel expansion sleeve over bolt and place into the drilled hole.
- Place the washer onto the expansion bolt.
- Thread nut onto expansion bolt and tighten until maximum expansion of steel expansion sleeve has been achieved.
- Remove nut and washer and place anchor head over exposed bolt.
- Place washer and nut onto bolt to attach anchor head, tighten nut.
- Concrete must be a 2500 PSI minimum slab with 4” minimum thickness.
- Concrete slab must allow 4725 lbs of vertical tension on anchor without lifting. This assumes that the concrete weighs 150 lbs per cu. ft.
- Minimum distance from the anchor shaft to one edge of the slab is 4 in. from one edge and 6" from any other edge.

Note Applies to all anchors on this page:
- Maximum load per anchor is 4725 lbs.
- Minimum slab area per anchor for 4725 lbs:
  4" Thick Slab: 95 S. F.  
  6" Thick Slab: 65 S. F.  
  8" Thick Slab: 48 S. F.
- When installed in slabs with a thickness of 4” or less, a layer of 6/6 or 10/10 mesh in recommended.
Cross Drive Rock Anchor - MRA

Engineered for installation into solid rock within 1 in. from bottom of the anchor base. Exact alignment is achieved with the swivel tensioning head.

1. Drill 5/8” diameter hole 5-1/2” deep in center of anchor location. Insert pilot stud into hole.

2. Drill two 3/4” diameter holes, (the length of the rods) into the rock at 45° angles, using the anchor head as a locating guide.

3. Place rod through top and corresponding bottom web flange and into 45° hole. Drive rod into rock. Rod must be driven into rock at least 80% of its length to achieve minimum allowable pullout resistance. Repeat using 2nd rod.

- Maximum pullout resistance is developed when ground surface is solid rock. Maximum distance from lowest edge of anchor flange to rock surface is 1 in.

X-Plate Anchor with Stabilization Plate

Painted Part #59118  Galvanized Part #59118G
X-Plate for Soil Class 2
2 - 23/32” x 30” rods included.

Engineered for installation into difficult ground conditions that, when tested with a soil test probe, exceed 500 in. lbs. (see notes below).

Using a soil test probe, determine the soil classification. Place the X-Plate parallel to the building being secured with the flat plate to the inside. Pound the plate into the ground so that the upper lip is ground level. Using a heavy hammer or electric hammer gun, pound rods into the ground through the box tubing guides welded onto the back side of the stabilizer plate. Rods should be installed until maximum 2” above the box tubing. Install strap as required.

Notes:
1. For Wind Zone 1 use only, max working load of the X-Plate is 2,200 lb. (3,300# ultimate).
2. It takes 1-1/2 X-Plate anchors to replace 1 standard class 2 ground anchor with a 3150 lb. working load.
3. Difficult Soils Only - Defined as “Extremely hard soil preventing the installation of an auger anchor to its full depth using a 1/2 HP Drive Machine”. Torque probe readings at 12” to 18” of the surface must be 500 ”/# min.
4. Cross drive anchor is NOT rated or intended to be used for direct pull in vertical direction. Angle of resultant load must be at 40-50 degrees from vertical. This anchor may not be appropriate for shear wall or column anchorage.
1. INTRODUCTION

At the request of Tie Down Engineering, RADCO investigated the possibility of listing ground anchors produced by Tie Down Engineering, for approval of ground anchors in accordance with RADCO’s Listing Requirements for Ground Anchors.

RADCO’s Listing Requirements for Ground Anchors defines the classification and performance requirements of each respective ground anchor model. The requirements are in general accordance with those developed by the MHI Ground Anchor Task Force and adopted by HUD’s MHCC on March 9, 2011 after accepting minor revisions offered by HUD staff.

2. DESCRIPTION

There are three categories of ground anchors that are specified in this listing. The first group is soil ground anchors, which pertain to all anchors designated for soil classes 2, 3, 4, and 5. The second group is concrete (non-soil) ground anchors, which are designed for installation into class 1 conditions. The third group is a set of soil ground anchors which serve as an alternate to the HUD minimum requirements and are listed with a working load which is less than the requirements prescribed by the MHI Ground Anchor Task Force and adopted by HUD’s MHCC on March 9, 2011.

All Tie Down Engineering Ground Anchors are manufactured using steel in conformance with ASTM A-36. The models under this listing vary with respect to shaft diameter, number and location of helixes, length of shaft and stabilizer device. Table 1 shows a complete description of each ground anchor model, as well as a corresponding stabilizer device.

All ground anchors have a minimum working load of 3,150 lbs and a minimum ultimate load of 4,725 lbs, with the exception of the anchors listed in Table 3.

3. INSTALLATION

The installation of the ground anchors is to be in accordance with the Manufacturer’s Installation Instructions, as well as:

   a) The proper soil class. (Tables 1 & 3, and notes)

   b) Minimum angle of pull to the horizontal. (Tables 1 - 3)

4. EVIDENCE SUBMITTED

4.1 Testing has been conducted to verify the compliance of Tie Down Engineering ground anchors to the RADCO Listing Requirements for Ground Anchors.

4.2 The Quality and process control system used in the manufacture has been submitted to RADCO. An adequate method of traceability is maintained by the manufacturer. A follow-up Quality assurance audit program is maintained by RADCO.

5. RECOMMENDATIONS

RADCO recommends that Tie Down Engineering ground anchors be accepted for use with HUD code manufactured homes and modular homes provided that:

5.1 Each ground anchor will be marked with a label, a facsimile of which is shown in figure 1. The label for each facility denotes the RADCO name, and Listing #1349.

5.2 All products are produced only at the facility referenced in this listing.

5.3 The quality control procedures are maintained by the manufacturing facility as submitted.

5.4 The audit system of RADCO is maintained.

5.5 All products are installed per the manufacturers installation instructions and section 3 of this listing.

6. APPROVAL

This listing is subject to approval on an annual basis by RADCO. Updating and further information will be included and/or resubmitted as necessary.

Soil Classification Chart

Ground anchors are designed for different soil classifications: longer models for loose soils, shorter models for harder soils. Prior to installing any ground anchor model, the soil must be tested (with a Soil Test Probe) in order to match approved ground anchor model with site soil class.

**WARNING**: Before ground anchor installation, determine that the anchor locations around home will not be close to any underground electrical cables, water lines or sewer piping. Failure to determine the location of electrical cables may result in serious personal injury.

**Soil Test Probe**
The Soil Test Probe is used to determine the soil conditions below the surface near the anchor's helix. Using the Soil Test Probe will ensure maximum anchor holding strength by indicating the proper anchor model for each soil condition.

**Instructions**
1. Place probe tip into ground where you intend to place the anchor. Using a 15/16” hex socket with a ratchet or breaker bar, rotate the probe in a clockwise direction. (An electric drive machine with an adaptor head may also be used)
2. Drive (rotate) the torque probe into the soil until reaching a depth equal to the length of the anchor being installed.
3. To determine the soil classification:
   - Place wrench adaptor onto torque wrench.
   - Insert hex portion of wrench adaptor onto the earth probe.
   - Support probe shaft with one hand, while rotating probe steadily with the wrench. (Do not exceed 600 in. lbs.)
   - Read the torque wrench while rotating probe clockwise.
   - Use the soil classification chart to cross reference probe readings. Color codes match those printed on Tie Down's torque probe.
4. If probe reading does not match the anchor for that depth, rotate probe to next anchor depth and check reading. Continue until reading on probe matches anchor length for depth of reading.
5. To remove probe, use wrench or electric drive machine in reverse (counter clockwise).

Installation Instructions for ABS Pads

1. Pier spacing must be in accordance with the Manufacturers Installation Manual and/or State or local requirements.
2. Clear all vegetation and debris from area where pads are to be placed.
3. The ground under the pads must be leveled and evenly compacted or undisturbed soil.
4. Determine pad size by testing for the soil bearing capacity, if soil testing not available, use the 1000 PSF soil column of the instructions.
5. Place ABS pad with grid side up, smooth side down. Center blocks or pier on pad and complete Installation.

![Diagram of ABS Pad and Concrete Block]

**IMPORTANT**
If pad deflects more than 3/8” when installed correctly with home’s dead load applied, then the pier spacing is incorrect for soil conditions.

**Pad Bearing Capacity**

**Multi Pad Layout**

- 32" X 22.5" (See 1 below) 3 X 59301 5,000 lbs. 7,500 lbs. 10,000 Lbs.*
- 34.4 X 25.2 (See 2 below) 3 X 59302 6,000 lbs. 9,000 lbs. 12,000 Lbs.*

* Concrete Block rated @ 8000 lbs. Double block any higher loads.

**General Notes:**
1. Any configuration from the chart may be used to replace a concrete or wood base pad per 3282.312(A)(3).
2. The maximum load at any intermediate soil value may be interpolated between the next lower and next higher soil values given in the pad bearing capacity chart.
3. Pad sizes are shown in nominal dimensions and may vary slightly.
4. Maximum deflection 3/8”, measured from the highest point to the lowest point of the top side of pad.
5. In areas susceptible to frost heave, the pad must be at the frost line or otherwise protected from the effects of frost. Refer to NCSBCS/ANSI A225.1 “Manufactured Home Installations” Homes set to Standard 24 CFR 3285 should not be susceptible to frost heave.
LISTING & TESTING DIVISION

PRODUCT: ABS & Steel FOUNDATION PADS

LISTEE: TIE DOWN ENGINEERING, INC.
5901 Wheaton Drive
Atlanta, GA 30336

CATEGORY: DESIGN - FOUNDATION

APPLICATION: MANUFACTURED HOME - FOUNDATION

SECTION 1: INTRODUCTION
At the request of Tiedown Engineering, Inc., RADCO has examined their ABS Foundation Pads and Steel Pads to determine the design load capacity in accordance with Section 3280.401(b) of The Federal Manufactured Home Construction and Safety Standards.

SECTION 2: DESCRIPTION
ABS pads are molded pads having continuous ribs running parallel and diagonal with the pad sides. The Steel pads are made of 12 gage galvanized steel. The pads may be used to distribute concentrated pier loads to underlying soil for manufactured housing constructed in accordance with The Federal Manufactured Home Construction and Safety Standards 24 CFR Part 3280. The ABS pads are available in various sizes as noted in Table 1.

SECTION 3: APPLICATION
The pads shall be installed in accordance with the manufacturer's installation instructions. The maximum design concentrated loads are provided in Table 1.

SECTION 4: EVIDENCE SUBMITTED
g) Test report of "Full Scale ABS Footer Test: by K2 Engineering, Inc. Test Report #01-MH17-TDE, August 2001."
h) Test report of "Vector-Xi Foundation Pad: by RADCO TestReport # RAD-3849, May 2006"

SECTION 5: RECOMMENDATIONS
RADCO recommends that these pads be accepted for use of pads in bearing capacity of soils listed in Table 1 for support of concrete masonry unit piers, provided that:

a) Each pad shall be fabricated, identified and installed in accordance with this listing, the manufacturer's published installation instructions, and the applicable code(s). In the event of a conflict between the manufacturer's published installation instructions and this listing, this listing shall govern. The installation instructions shall be available at the point of installation.

b) Each pads shall be marked with manufacturer name and address, product name, RADCO name/logo and Listing #1345.

c) The ABS pads are of the same quality and size as tested by K2 Engineering, Inc. The steel pad is the same quality and size as tested by RADCO.

d) Piers are limited to steel piers or single or double stacked concrete masonry unit blocks of this listing.

e) The design pier load does not exceed the lesser of the pad capacity, soil capacity or pier capacity.

f) The home installer is responsible for the foundation design of each home.

g) RADCO’s follow-up audits be continued at the prescribed frequency.

SECTION 6: APPROVAL
This listing is subject to approval on an annual basis by RADCO. Updating of data and further information will be submitted as necessary.
Adjustable Outrigger/Diagonal Strut Installation

1. Determine floor joist area needing support.

2. Set mounting plate on floor joist and secure with 7 (#12x2”) screws provided. Approx. 6” from outer rim joist.

3. Insert threaded adjuster bolt in support tube so it clears I-beam flange when mounting Plate is inserted and chisel end is placed against the frame. If support tube is too long, simply cut square to desired length.

4. Raise floor joist with jack to desired level before tightening the nut on the threaded bolt, snug fit to 1/4 turn past.

5. Replaces perimeter piers required for window and door support and alignment except as required by the home manufacturer for larger openings.

6. Built to Federal Manufactured Home & Safety Standards, for maximum openings up to 6’ for 20lb. roof load, 4’ for a 30 lb. roof load or 3’ for a 40 lb. roof load per set of adjustable outrigger.

7. Outriggers can be used on openings up to 8’ wide on roof loads up to 30 lb. when 2 outriggers are placed on each side of the opening. Place 1 outrigger on the first floor joist inside the opening and 1 outrigger on the first joist outside the opening. If the wall jamb falls directly over a joist, place 1 outrigger on that joist and the other one on the first floor joist inside the opening.

8. Installation of each outrigger should be in accordance with these instructions within 3’ of a pier support or standard outrigger.

Do not use on homes while being transported.

Note: This component is not designed or intended to replace any foundation supports required by the home’s manufacturer and is not a repair for damaged joists. These instructions address the capacity of the adjustable outrigger only.
Steel Support Pier Installation Instructions

Please refer to the Installation instructions provided by the manufacturer, and or State and local regulations as to the pier placement and beam spacing. Check specific load requirements for footings and pier pads along with wind zone requirements for new or used manufactured units. Steel Support Piers are designed for use as a replacement for dry stacked blocks, piers available up to a maximum of 30 inches.

1. After the unit has been put in place and leveled with the appropriate safety equipment, begin placing the piers under the main beams at manufacturers specified distance.

2. Center the Pier on the footing or pad using fasteners (4 #14 X 2” screws if required) tighten pier head with 3/4” nut below pier top so the head is tight against the beam. Part 3285.304 of the new HUD installation rule specifies that “Manufactured pier heights must be selected so that adjustable risers do not extend more than 2” when finally positioned”.

Steel Support Piers are designed and tested to vertical loads for a support t rating of 6,000 lbs. Support Piers can be used under factory built structures such as manufactured homes, mobile commercial units, classrooms, multiplexes, sheds and other similar structures. They can be used in all wind zone conditions, except “Exposure D” within 1500 ft. of the coastline. Support piers are designed for use with a variety of heads to prevent movement after attachment to the beam or screwed to the marriage line; check local codes and manufacturers requirements for proper installation regulations for beam and marriage line installation.

When all Support Piers are installed, remove your safety equipment and go to the next step in set up.

### Notes:

- Engineering data based on weight of a empty tank.
- (2) - 2 straps or cables recommended for stabilization on longer tanks in high winds.
- Eye or mobile home anchors must have a minimum of 5/8” shaft.
- Class 2 Soils require minimum of 30” anchor with (2) 4” disc.
- Class 3 Soils require minimum of 34” anchor with (1) 6” disc.
- Class 4A Soils require minimum of 48” anchor with (1) 6” disc.
- Class 4B Soils require minimum of 60” anchor with (1) 6” disc.
Emergency Spring Hanger Kits
For temporary replacement of broken spring hangers or additional axle installation when needed in the field. Kits available with 4 or 8 bolt front brackets for differing trailer types and weights. Spring not included. Plates are adjustable for 3” or 4” I-Beams. Not intended for use over 45 mph.

Installation Instructions
When adding an axle, begin by attaching the larger bracket to the I-Beam towards the front of the unit and leave bolts loose so the bracket can slide on the beam. The spacing for the hangers is generally 1/2” shorter than the distance between the “eyes” of the spring. Attach the smaller bracket behind the larger one with shackle links installed and leave the bolts loose so this bracket can slide on the beam. Follow these same steps and install the brackets to the beam on opposite side. Position axle under brackets and start by attaching rear of leaf springs to shackles on both sides with shackle bolts and snug but do not tighten. Install front of leaf springs to the large spring hangers and adjust spring and shackles to fit. Tighten all bolts at this time, making sure the bolts on the I-beam are tight.
Web Site Information

TIE DOWN ENGINEERING has over 600,000 sq. ft. of manufacturing facilities servicing 6 product divisions. The tiedown.com web site is divided into the six different product divisions and Manufactured Housing is the second largest division.

We try to include everything possible about manufactured housing as we can. All available information is located in the Manufactured Housing Division site at www.tiedown.com.

State Approvals and State Instructions - Simply click on your state and see any state specific approval letters for foundation systems, anchors, pads & state specific installation instructions.

Test Reports - All available test reports for TDE manufactured housing products. Reports are listed in one convenient PDF catalog. Simply click on the test report you need and the report will automatically download to your computer. Test Report Data is password protected and access is giving by calling Tie Down Customer Service.

Wind Zone Map - Wind Zone Comparisons (HUD’s MHCSS and FEMA 85)

Download Library - Installation instructions (non state specific) including foundation systems, anchor installation and general instructions for Manufactured Housing.

On Line - Manufactured Housing Products Catalog

All TDE manufactured housing products are included with purchase quantities. Listed beside each product (if available) is a PDF icon which when clicked will automatically download the instructions to your computer.
